DETAILED ACTION

Election/Restrictions

Applicant's election without traverse of claims 1-3 in the reply filed on 10/26/05 is acknowledged.

Claim Rejections - 35 USC § 102

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-3 are rejected under 35 U.S.C. 102(e) as being anticipated by Segal et al. (US 6574130).

The applied reference has a common inventor with the instant application.

Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

Regarding claim 1, Segal discloses a discrete electro-mechanical device, comprising:

a structure including an electrically-conductive trace (104, Figs. 2A-B);

a defined patch of nanotube fabric (101, Figs. 2A-B) disposed in spaced relation to the trace; and

wherein the defined patch of nanotube fabric is electromechanically deflectable between a first and second state, wherein in the first state the nanotube article is in spaced relation relative to the trace, and wherein in the second state the nanotube article is in contact with the trace (Figs. 2A-B and Col. 4); and

a low resistance signal path (104, Figs. 2A-B) in electrical communication with the defined patch of nanofabric.

Regarding claim 2, Segal further discloses wherein the low resistance signal path (104, Figs. 2A-B) is a metal signal path in contact with the defined patch of nanotube fabric (Col. 4).

Regarding claim 3, Segal further discloses wherein the structure includes a defined gap into which the electrically conductive trace is disposed, wherein the defined gap has a defined width, and wherein the defined patch of nanotube fabric spans the gap and has a longitudinal extent that is slightly longer than the defined width of the gap (Figs. 2A-B and Col. 4).
